- I have experience in both Front End and Back End development, gained through internships, university, and external projects. My backend work involves MySQL, PostgreSQL, MongoDB, and database optimization, while my frontend experience includes HTML, CSS, JavaScript, PHP, React, JQuery, Javascript, Tailwind, and Bootstrap. I also have a strong interest in design and have applied it in various projects, learning tools like Figma from scratch.
- Currently based in Tangerang, Indonesia, I am highly adaptable and quick to acquire new skills, both technical and soft skills. I am learning Japanese with the goal of working in Japan, driven by a long-standing interest in its culture. For me, continuous learning, a positive attitude, and a strong work ethic are essential to staying relevant and excelling in the tech industry.

Education

2021 - 2025

Multimedia Nusantara University

Majored in Informatics with a focus on front-end development, networks, security, AI algorithms, and human-computer interaction. Highly committed to continuous learning and skill development through academic work and practical projects.

Bachelor of Informatics - GPA: 3.59

Experience

PT Cermat Makmur Abadi International

Creating Cermat Shop, which functions to view stock, as well as manage orders and payments made within the website, similar to typical online shops using Laravel. Studying ERP and demonstrating it from the establishment of the company. Maintaining the KITEC website to be used by Bea Cukai for recording goods imported for export purposes, using .NET Framework.

IT Intern (July 2024 - December 2024)

PT Kalbe Farma TBK

Created several projects to increase input efficiency using MERN Stack and Laravel. Creating a website for machine scheduling in the production department for 1 week or 8 days. In addition, there is also Preventive Maintenance (PM) used by engineers to add maintenance schedules for a full month.

Front End, Backend, & UI/UX Intern (July 2024 - December 2024)

E-learningKu

This website was built using the Laravel framework with a MySQL backend over approximately four months. It integrates an Intelligent Tutoring System (ITS) and a Bayesian Network model to adaptively generate additional learning tasks based on each student's performance.

The project is an e-learning platform designed to enhance student performance by analyzing their quiz and assignment results. The system automatically identifies areas where students struggle and generates additional tasks with difficulty levels tailored to each individual. Using the Bayesian Network model, it calculates the optimal distribution of easy, medium, and hard questions for these tasks, making the learning process more adaptive and personalized.

JPM (Kalbe Farma)

Jadwal Project Mingguan (Weekly Project Schedule)

In this project, I served as the Front-End Developer, Back-End Developer, and UI/UX Designer. The system was built using Laravel with a PostgreSQL backend and was developed for the internal use of the Production Division at PT Kalbe Farma Tbk.

The website is designed to record machine operations over the course of a week, where one “week” consists of eight days. In this scheduling format, Monday at the end of Week 1 becomes the first Monday of Week 2. The recording process is carried out by supervisors and is fully automated for yearly operations—meaning there is no need to manually input the year, month, or week, as the system handles these automatically.

Additionally, the system features a highly detailed audit and history log. Every change, no matter how small, is recorded to meet the strict traceability requirements of the pharmaceutical industry. This ensures complete transparency and compliance with regulatory standards.

The image shown is a design mockup, as the actual website cannot be publicly shared.

Organizational Finance Application

Developed an Android application using Kotlin with a MongoDB backend, built in Android Studio, designed to manage fine records within university organizations. The application allows users to create organization groups with special access, where the creator becomes the admin. Members can join groups using a unique code generated by the admin, but access requires admin approval. Once approved, members can contribute monthly or weekly dues, while late payments automatically incur fines. Payment is validated through user-uploaded screenshots, which are manually reviewed by the admin.

The Struggles

Unity Game Project: Labyrinth

This Unity-based game blends Maze Escape, Horror, and First-Person Shooter elements. Set in a dark, maze-like hospital, players must find the exit while battling monsters and managing limited flashlight power. They can switch between a flashlight and various weapons, but not use both at once, making resource management crucial.

Atmospheric audio, realistic shooting, and immersive visuals enhance the tension. The main menu offers Play, Credits, and Quit options, with assets sourced from the Unity Asset Store. My role focused on designing and building the maze layout to ensure challenging navigation and engaging gameplay.

UMN Life

Clicker Bar Balancing Game 1.0

This web-based game, built with jQuery and without a database, stores all data using local storage. It was created as a tutorial for navigating university life, where the objective is to complete 8 semesters by studying. Each in-game time period features a different background. The game includes a money system that can be used for food, with income increasing every second. The game ends either when the player successfully completes all 8 semesters or if any one of the indicators runs out. An optional feature allows the player to add a partner, enhancing the overall gameplay experience.

UMN Life

Clicker Bar Balancing Game 2.0

This web-based game, built with React and utilizing local storage, is designed to be completed within 7 in-game days and ends in failure if any one of the bars is depleted. It is an updated version of UMN Life, maintaining the same core gameplay mechanics but introducing a refreshed design and slightly modified game rules.

In this updated version, players can visit multiple locations such as the university, café, mall, and home, each offering different activities to influence the character's stats. The update also introduces dynamic weather, a smartphone feature for boosting certain bars, and context-based character dialogues—for example, expressing hunger or fullness depending on the status of specific bars. The game concludes successfully when all 7 days are completed without any bar reaching zero.

Thank you
